

Attachments

A file carried inside the document — which is what an e-invoice is.

There is an XML file inside this PDF. Any reader with an attachments panel will offer it; a Factur-X reader finds it without one, by following the /AF entry and the relationship it was attached with.

Why it matters

Germany's e-invoicing mandate is phasing in, France's follows, Italy's has been running for years. All of them want the structured invoice. Factur-X says how: one PDF/A-3 carrying the invoice as XML, so the same file is both the document a person reads and the record a system parses.

What this page cannot claim

- Text is set in the base-14 fonts, which are not embedded. PDF/A requires every font to travel with the file — attach a family with ``pdf.family`` or pass ``face:``.

So this example carries its attachment but does not claim PDF/A-3. swift-invoice-pdf has one that does, set in an embedded face.
